

User Guide

What's in the box:

1 x Byte-dock

Instructions can be found at the following URL:

www.byte-dock.com/support

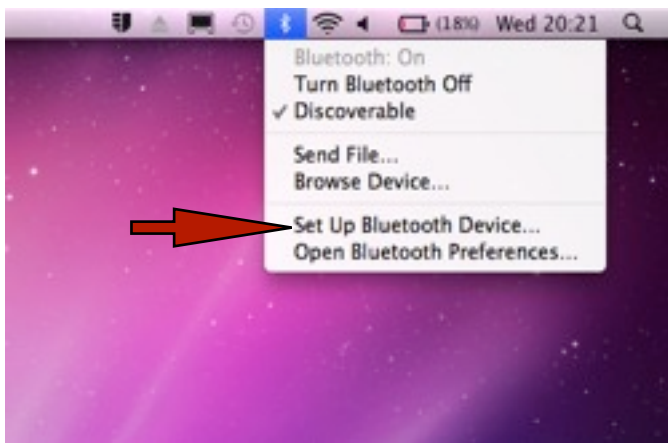

Please take the time to read through this instructional document prior to docking your MacBook Pro for the first time.

Before you get started with your brand new Byte-dock, you need to make sure your Bluetooth mouse and keyboard have been paired for the first time.

Note: If you are using Apple peripherals you will only need to set up this step once.

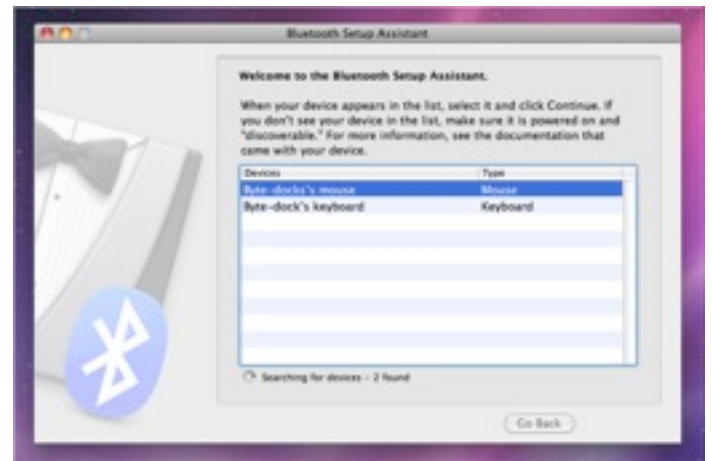

Note: If you are using non-Apple products you will need to consult the manufacturer's operating instructions.

First step: Setting up keyboard and mouse.

1. Select the Bluetooth icon from the top bar.
2. Select the set up Bluetooth device.

3. Select the devices you wish to pair.
4. Follow the on-screen instructions.

5. Once connected, your Apple keyboard and mouse will always connect to your MacBook Pro once they are in range.

Second step: Setting up the display.

1. Use the HDMI to MiniDisplay cable (if you have purchased one) with your new Byte-dock to connect your MacBook Pro to your desired TV or monitor.

Third step: Setting up the audio output. (Only for audio via Minidisplay to HDMI cable (if you have purchased one)).

1. Select system preferences from your dock.
2. Select sound from your hardware menu.

3. Select 'Output' from the task bar.
4. Select the HDMI device for your audio output.

Final step: Setting up your Byte-dock.

1. Ensure all the above steps have been completed on your MacBook Pro. Remove the Byte-dock from its packaging.
2. Setup the Byte-dock by connecting your peripherals to it via the required inputs and making sure your MacBook Pro is configured as per the steps on the previous pages.
3. Once all your peripherals are connected to the Byte-dock, make sure the lid is closed and that the MacBook Pro is asleep.
4. From this point all you have to do is dock your MacBook Pro and wake it up (by pressing a button on either the connected mouse or keyboard). You may have to wait a few seconds whilst the MacBook Pro detects the screen and wakes up.

1. **No Image Displayed on monitor** - If you have no image being displayed make sure that you have the power connected to your MacBook Pro. If it is properly connected then make sure the cable is inserted correctly.
2. **No audio output via HDMI** - If you cannot hear any sound from your device please go back and make sure you have setup as described above and have changed your sound output in the option on your MacBook Pro. If you are still unable to get audio from your desired output device via the Minidisplay to HDMI (if you have purchased one) cable try reseating the cable in the dock. If you still cannot hear anything make sure the volume is turned up.
3. **Display Issues** - Should you see any issues with the displayed output via the Minidisplay to HDMI cable (if you have purchased one), please try removing and putting the cable back in. If you have multiple converters please make sure they are all secure. If you still experience an issue try restarting your MacBook Pro.
